

## vein removal information fact sheet

Vein removal has previously involved anesthetics, doctors and invasive procedures, but now the SplashLaser can do the job better and with less recovery time. The wonders of modern technology!

### *How?*

The SplashLaser harmlessly passes through the skin to selectively target unsightly spider or blue veins, or even, superficial dilated blood vessels on the face. The vessels are immediately “wiped out” without the risks of scarring and hypopigmentation.

### *Will it hurt?*

There may be some feeling of heat or “prickling” but most patients experience minimal or no pain at all.

### *Is there any recovery?*

Immediately following the treatment the skin may show some redness. There may be some bruising around the treated area initially which will disappear within a week.

### *Is it permanent?*

Yes. If you are prone to vein development, veins may develop in other areas, but not in the area treated by the SplashLaser.
